Standard Circuit

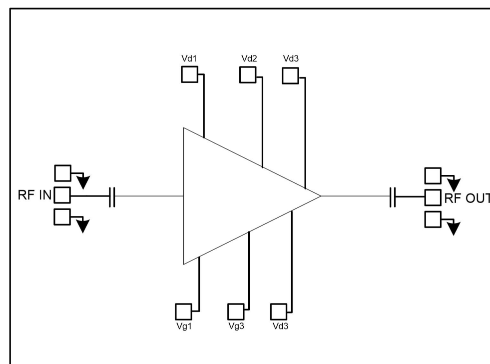
IPA-1724A

GaAs MMIC Power Amplifier Chip, 17-24GHz

Performance characteristics

Frequency range: 17-24GHz
Small signal gain: 25dB
Gain flatness: ± 1.5dB
P-1dB: 25 dBm
Psat: 25.5 dBm
Power supply: +5 V/ 220 mA
50Ohm input/output
100% on-chip testing
Chip size: 1.96 x 1.5 x 0.1mm

Functional Block Diagram



Product Introduction

GPA- 1724A is a broadband amplifier chip based on GaAs technology, covering a frequency range of 17~24GHz, with a small signal gain of 25dB and a saturated output power of 25.5d Bm. The chip is powered by a +5V power supply. The chip through-hole metallization process ensures good grounding, and the back side is metallized, which is suitable for eutectic sintering or conductive adhesive bonding process.

Use restriction parameter [1]	
Maximum drain voltage	+8 V
Maximum input power	+20dBm
Operating temperature	-55 ~ + 85 °C
Storage temperature	-65 ~ +150°C

【1】 Exceeding any of these maximum limits may cause permanent damage.

Electrical performance parameters (TA = +25°C , Vd = +5V)				
Index	Minimum	Typical Value	Maximum	Unit
Frequency Range		17-24		GHz
Small Signal Gain	twenty four	25	27	dB
Gain Flatness		± 1.5		dB
P -1 dB		25		dBm
Psat		25.5		dBm
Input return loss	10.5	15		dB
Output return loss	14	20		dB
Quiescent Current		220		mA
Working current		240	250	mA
* By tuning the Vg terminal voltage -2V~0V , the recommended gate voltage is -0.85V.

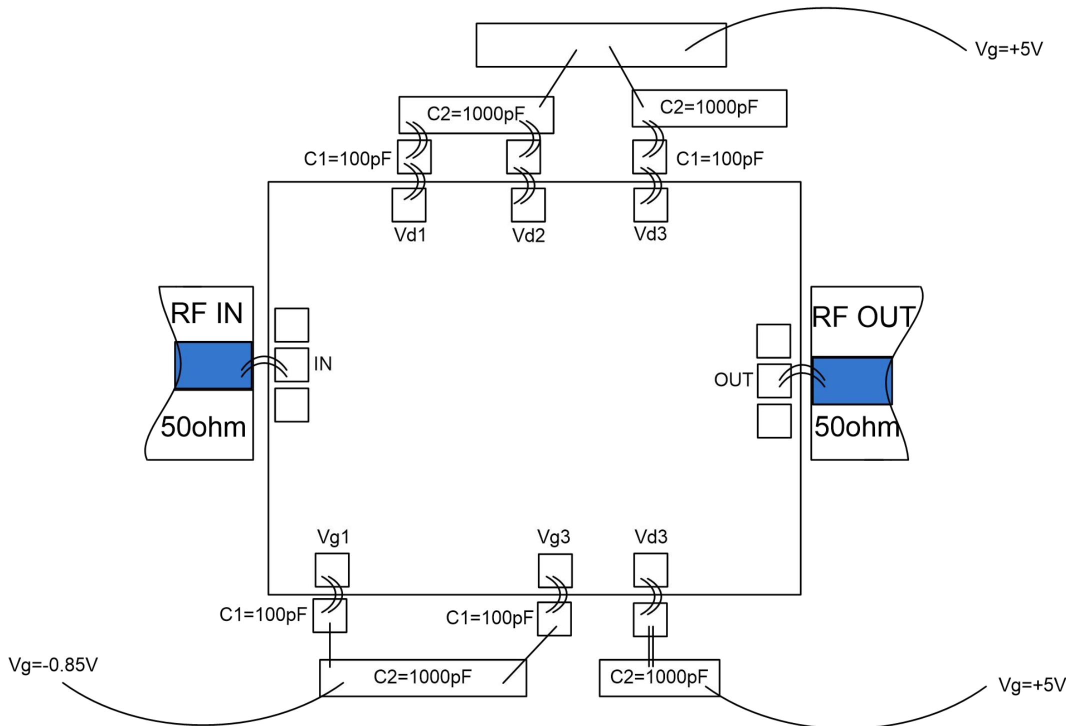
Bonding point definition		
Bonding point number	Function Symbol	Functional Description
1	RF IN	RF signal input terminal, no DC blocking capacitor required
2	RF OUT	RF signal output terminal, no DC blocking capacitor required
3, 4, 5, 8	Vd 1~Vd3	Amplifier drain bias, external 100pF , 1000pF bypass capacitor required
6, 7	Vg1 ~Vg3	Amplifier gate bias, external 100pF , 1000pF bypass capacitors are required
Chip bottom	GND	The bottom of the chip needs to be in good contact with the RF and DC grounds

GaAs MMIC Power Amplifier Chip, 17-24GHz

Recommended assembly diagram



Notice

- The chip must be stored in an anti-static container and kept in a nitrogen environment.
- Do not attempt to clean the bare die surface using wet chemical methods.
- Please strictly follow the ESD protection requirements to avoid static damage to the bare chip.
- General operation: Please use precision pointed tweezers to pick up bare chips. Avoid touching the chip surface with tools or fingers during operation.
- Rack mounting operation suggestions: Bare chip mounting can be done by AuSn solder eutectic sintering or conductive adhesive bonding. The mounting surface must be clean and flat.
- Sintering process: It is recommended to use AuSn solder sheets with a gold-tin ratio of 80/20. The working surface temperature reaches 255 ℃ and the tool (vacuum chuck) temperature reaches 265 ℃ . When the high-temperature mixed gas (nitrogen-hydrogen ratio of 90/10) is blown to the chip, the temperature at the top of the tool should be raised to 290 ℃ . Do not let the chip exceed 320 ℃ for more than 20 seconds. The friction time should not exceed 3 seconds.
- Bonding process: The amount of conductive glue dispensed should be as small as possible. After the chip is placed in the installation position, the conductive glue can be vaguely seen around it. For curing conditions, please follow the information provided by the conductive glue manufacturer.
- Bonding operation suggestions: Use Φ0.025mm (1mil) gold wire for both ball and wedge bonding. Thermosonic bonding temperature is 150 ℃ . The pressure of the wedge bonding knife is 40~50gf for ball bonding and 18~22gf for wedge bonding. Use the smallest possible ultrasonic energy. The bonding starts at the pressure point on the chip and ends at the package (or substrate).
